Announcement of change in W-NK gas meters

Thank you for your continued patronage.

Our W-NK series of wet gas meters have thus far used analogue thermometers for both gas temperature and liquid temperature. Starting from January 2014, this series will instead be using digital thermometers.

We have received feedback stating that the current analogue thermometers are fragile and difficult to read, and so these will be replaced by two digital thermometers, both placed on the front of the meter (please see the below picture for an illustration). These thermometers will be more robust, and it will be easier to read the digits from the digital display.

The thermometer's accuracy will be as before, $\pm 1.0^{\circ}\text{C}$. The meter will use AA batteries, with an easily accessible battery box on the side of the meter. We can convert your existing meters (for a fee); please contact us if you are interested in a conversion (Please note that the shape of the battery box will differ from that on a new meter).

It is still possible to use the analogue thermometer, though additional parts are needed to attach it.

We will continually strive to make our products easier to use, and we appreciate all your feedback.

Best Regards,

Shinagawa Corporation
